information

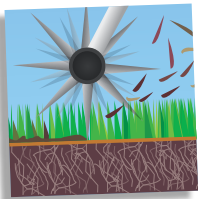

Dear customer

We hope that you have been happy with the results so far from the treatments that we have applied to your lawn. Over the winter months is when we tackle other problems with your lawn such as soil compaction, thatch and risk of damage caused by the larva or the crane fly. Below are details of these extra treatments which will further improve your lawn.

Aeration

This will reduce soil compaction. When soil is compacted it reduces the amount of water, air and nutrients that can get to the roots of the grass, so impeding the growth and health of your lawn.

Scarification

This will reduce the build up of surface thatch and also remove any moss killed during treatment 4. Over time your lawn will get a build up of debris on the soil surface called thatch. This creates a waterproof layer which will reduce the amount of water and nutrients that can get to the roots of the grass.
